PROBLEM IDENTIFICATION, DEFINITION & MODIFICATION

1.1 Abstract

Online grocery shopping is a modern e-commerce platform that enables customers to conveniently purchase fruits, vegetables, and other grocery items from the comfort of their homes using a computer or mobile device. Customers can browse the product catalog, select items, and add them to a virtual shopping cart. Upon checkout, orders are prepared and delivered directly to the customer's doorstep at a selected delivery timeslot. Payment is accepted via Cash on Delivery upon receipt of goods.

Key Functionalities:

- Admin can monitor all activities within the online grocery shop.
- Admin can add, update, and delete grocery items (fruits, vegetables, etc.).
- Admin can verify and manage customer orders.
- Users can view, search, and browse the complete grocery catalog.
- Users fill an order form with their name, address, city, delivery timeslot, and payment method (Cash on Delivery).
- Grocery items are delivered to the user's home within the selected timeslot.

1.2 Existing System

Process & Limitations:

- **Physical Travel:** Customers must travel to a supermarket or grocery store in person.
- **Customer Effort:** Shopping involves dealing with crowds and standing in long checkout queues.
- **Time Constraints:** Shopping is restricted to store operating hours, limiting customer flexibility.
- **Product Information:** Customers must manually check prices and compare offerings across multiple physical stores.

1.3 Technology Overview

The Online Grocery Shopping System relies on a well-structured set of technical components to deliver a seamless e-commerce experience. The following system architecture components form the backbone of the platform:

- **Customer Management:** Handles user registration, profiles, and interaction history.

- **Shopping Management:** Manages the product browsing experience and cart operations.
- **Order Management:** Processes and tracks all customer orders from placement to delivery.
- **Payment Management:** Handles payment transactions, supporting Cash on Delivery initially.
- **System / User Management:** Covers registration, authentication, and access control for users and administrators.
- **Login Management:** Provides secure login and session management for all user roles.

2

SYSTEM REQUIREMENT GATHERING & SPECIFICATION

2.1 Introduction

This chapter presents the Software Requirements Specification (SRS) for the Online Grocery Shopping application. It outlines the purpose, scope, and detailed functional and non-functional requirements of the system.

Purpose

The purpose of this SRS document is to define all requirements for an online grocery shopping application that allows customers to browse and purchase groceries conveniently via a web or mobile interface, without the need for physical store visits.

Project Scope

- User registration and secure authentication.
- Product browsing by category, search filters, and keyword lookup.
- Virtual shopping cart with add, update, and remove capabilities.
- Checkout process with delivery details and payment integration.
- Order tracking and status updates for customers.
- User profile management and complete order history.
- Administrative functionality for product and inventory management.
- Initial version focuses on core e-commerce features for a single store.

Definitions, Acronyms & Abbreviations

Term	Definition
SRS	Software Requirements Specification
UI	User Interface
UX	User Experience
DFD	Data Flow Diagram
ER	Entity Relationship

2.3 Functional Requirements

Registration

Users must register with accurate personal details to establish a unique identity within the system. Registration is mandatory to access all features beyond the home page.

Login

After registration, users log in with their unique credentials to access personalised features and the full user interface.

Logout

Users can end their session securely. Logging out ensures the current user's session is terminated, also referred to as sign-out.

Forgot Password

Users can reset forgotten passwords by entering their registered email. A reset link is sent to the provided email address for quick recovery.

View Product

Displays complete product details including name, description, price, images, and associated data for a specific product.

Search Product

Enables users to search the product catalog using keywords. Displays matching results with details and enables browsing by category.

Add to Cart

Allows users to add selected products to their virtual cart. Cart persists across sessions, and quantities can be updated.

Product Details

Provides detailed listing information: name, brand, weight/volume, price, nutritional info, and high-quality images.

Pricing & Promotions

Store admins can set product prices and create targeted promotions and discounts for customers.

Reviews & Feedback

Users can read and submit reviews and star ratings to assist other shoppers in making informed decisions.

2.4 Non-Functional Requirements

Category	Description
Performance	System must handle concurrent users and process data within acceptable time frames.

Category	Description
Security	Protection from unauthorised access; ability to detect and recover from security breaches.
Usability	System must be intuitive and easy to understand for all end-users.
Reliability	System must function correctly and consistently under normal and abnormal conditions.
Maintainability	System must be easy to test, debug, and modify over time.
Portability	System must be transferable to different hardware or software environments.
Compliance	Adherence to applicable laws, regulations, industry standards, and company policies.

2.5 Problem Statement & Technical Feasibility

The traditional grocery shopping model forces customers to physically visit stores — a time-consuming and inconvenient process involving crowds and checkout queues. Comparing prices across stores is tedious. There is a clear need for an **efficient, reliable, and 24/7 accessible** digital platform that allows customers to shop from home. The Online Grocery Shopping System directly addresses this gap.

The project is **technically feasible**. It relies on well-established, mature web technologies — standard e-commerce architecture, relational database management, and common payment gateway integration. Core functional requirements (user authentication, product search, cart management) are standard components of modern web applications, and the team possesses the skills to implement them.

3

PROBLEM SOLUTION OUTLINE

3.1 Modules Description

The Online Grocery Shopping System is proposed as a dedicated web/mobile e-commerce platform serving two main stakeholders: the **User (Customer)** and the **Admin**.

User Workflow

- Customer registers and securely logs in to the platform.
- Browses the product catalog using search and category filters.
- Adds selected items to the virtual shopping cart.
- Proceeds to checkout, provides delivery details, and selects Cash on Delivery.
- Receives order confirmation and awaits delivery at the chosen timeslot.

Admin Workflow

- Manages the complete backend of the application.
- Verifies and processes incoming customer orders.
- Controls product inventory: add new items, update prices, delete discontinued products.

System Modules

Module	Responsibility
Login Management	User and admin authentication and session management.
Customer Management	Handles user registration, profiles, and account details.
Shopping Management	Product browsing, search, cart, and wishlist operations.
Order Management	Order processing, tracking, and status updates.
Payment Management	Handles transactions, currently supporting Cash on Delivery.
System / User Management	Admin controls for inventory, user roles, and access permissions.

3.2 Feasibility Study

A. Technical Feasibility

The project is technically feasible. It relies on proven and readily available e-commerce technologies including web architecture and relational databases. The team has the skills to implement login, product search, and cart logic.

B. Operational Feasibility

The project is operationally feasible because it directly solves the current inconvenience of physical shopping. The clearly defined roles for User and Admin ensure smooth integration into grocery operations without major procedural changes.

C. Schedule Feasibility

The project is feasible within the schedule. The initial scope is limited to a single store with core features (Cash on Delivery only). A structured three-phase timeline — Planning, Development, and Testing — provides a clear roadmap for on-time delivery.

4

DIAGRAMS

4.1 Use Case Diagram

The Use Case Diagram illustrates the interactions between the system actors (User and Admin) and the major system functions.

Figure 4.1 — Use Case Diagram for Online Grocery Shopping System

4.2 Activity Diagram

The Activity Diagram shows the step-by-step workflow of the online shopping process from product selection to order delivery.

*Figure 4.2 — Activity Diagram*

4.3 Data Flow Diagram (DFD)

A Data Flow Diagram models the flow of data between entities, processes, and data stores in the system.

4.4 DFD Level-0 (Context Diagram)

The Level-0 DFD presents the highest-level view — showing the system as a single process with external entities (User and Admin) and their data flows.

*Figure 4.4 — DFD Level-0 (Context Diagram)*

4.5 DFD Level-1

The Level-1 DFD decomposes the main process into sub-processes, detailing how data flows between modules such as Login, Shopping, Order, and Payment Management.

Figure 4.5 — DFD Level-1

4.6 Entity Relationship Diagram

The ER Diagram depicts the logical structure of the database, showing entities, attributes, and relationships between tables.

Figure 4.6 — Entity Relationship Diagram

5 DATA DICTIONARY

The Data Dictionary defines the structure of all database tables used in the Online Grocery Shopping system.

Table: Customer

Field Name	Data Type	Size	Description
username	VARCHAR	20	Unique customer username
password	NUMBER	20	Encrypted password
address	VARCHAR	100	Delivery address
email_id	VARCHAR	50	Registered email address

Table: Products

Field Name	Data Type	Size	Description
P_ID	NUMBER	20	Unique product identifier
P_name	VARCHAR	50	Product name
P_model	VARCHAR	20	Product model/category
P_password	NUMBER	20	Admin access code

Table: Payment

Field Name	Data Type	Size	Description
Payment_id	NUMBER	20	Unique payment record ID
Amount	NUMBER	20	Total payment amount
Payment_type	VARCHAR	20	Payment method (e.g. COD)

Table: Cart Item

Field Name	Data Type	Size	Description
cart_id	NUMBER	20	Unique cart identifier
Total_cost	NUMBER	20	Total cost of cart items
Quantity	VARCHAR	20	Quantity of each item

6

UI DESIGN

6.1 Customer Side

The following screenshots showcase the customer-facing interface of the Online Grocery Shopping system, covering product browsing, cart management, and checkout.

TESTING MODULE — BLACK BOX TESTING

Testing is a critical phase of the Software Development Life Cycle (SDLC). It verifies that the Online Grocery Shopping system works correctly and meets all functional requirements before deployment.

7.1 Black Box Testing — Overview

Black Box Testing is a software testing technique in which the tester evaluates the functionality of the application **without** knowledge of the internal code, structure, or implementation. The tester focuses exclusively on:

- **INPUTS** given to the system.
- **OUTPUTS / responses** produced by the system.
- Whether the **actual output MATCHES** the expected output.

This approach is ideal for testing the Online Grocery Shopping system because it tests the application exactly as an end-user would interact with it — through the UI, without any access to backend code.

Advantages of Black Box Testing

- No knowledge of internal code is required — any team member can perform it.
- Tests the system from the user's perspective, finding real usability issues.
- Can be performed at any stage of development.
- Helps detect missing or incorrect functionalities quickly.
- Suitable for both Functional Testing and Regression Testing.

7.2 Black Box Test Cases

The following test cases were designed and executed to validate all major modules of the system. Each test case includes the input, expected output, actual output, and final PASS/FAIL status.

TC ID	Module	Test Input	Expected Output	Actual Output	Status
TC-01	User Registration	Valid name, email, password	Account created, redirect to login	Account created successfully	PASS
TC-02	User Registration	Invalid email format (abc@)	Error: "Invalid email"	Validation error shown	PASS

TC ID	Module	Test Input	Expected Output	Actual Output	Status
TC-03	User Login	Correct email & password	Redirect to home page	Login successful	PASS
TC-04	User Login	Wrong password	Error: "Invalid credentials"	Error message displayed	PASS
TC-05	Product Search	Search "Tomato"	List of tomato products	Products displayed	PASS
TC-06	Product Search	Empty search box	Show all products	All products displayed	PASS
TC-07	Add to Cart	Click Add to Cart on product	Item added; cart count +1	Cart updated correctly	PASS
TC-08	Add to Cart	Add same item twice	Quantity updated to 2	Quantity incremented	PASS
TC-09	Checkout	Fill all fields & submit	Order confirmed, email sent	Order placed successfully	PASS
TC-10	Checkout	Leave address field empty	Error: "Address required"	Validation error shown	PASS
TC-11	Admin Login	Admin credentials	Redirect to admin dashboard	Admin panel opened	PASS
TC-12	Admin Product	Add new product with details	Product listed in catalog	Product added successfully	PASS
TC-13	Admin Product	Delete existing product	Product removed from catalog	Product deleted	PASS
TC-14	Forgot Password	Enter registered email	Reset link sent to email	Password reset email sent	PASS
TC-15	View Order	Customer checks order history	Order list with status shown	Orders displayed	PASS

7.3 Types of Black Box Testing Used

Equivalence Partitioning

Inputs are divided into valid and invalid groups. Example: valid email formats vs. invalid email formats during registration (TC-01, TC-02).

Boundary Value Analysis

Tests at the edge of input ranges. Example: minimum/maximum characters allowed in the password field.

Decision Table Testing

Tests combinations of conditions. Example: login with correct email + wrong password, wrong email + correct password (TC-03, TC-04).

Error Guessing

Tester uses experience to guess likely error areas such as empty cart checkout, duplicate registration with same email (TC-09, TC-10).

7.4 Step-by-Step Testing Guide

Step	Action	Description	Tool / Technique
Step 1	Identify Test Scenarios	List all features without looking at source code.	Requirements Document, SRS
Step 2	Design Test Cases	Create test cases with Test ID, Module, Input, Expected/Actual output, Pass/Fail.	Test Case Template (TC-01 to TC-15)
Step 3	Prepare Test Data	Create real input data: valid emails, wrong passwords, empty fields, product names.	Manual test data / dummy accounts
Step 4	Execute Tests	Open the application in a browser. Perform each test case one by one and observe responses.	Browser (Chrome / Firefox), Local Server
Step 5	Record Results	Write the Actual Output. Mark PASS if actual matches expected, else mark FAIL.	Test Case Table
Step 6	Report Defects	For any FAIL, note: what input caused it, what went wrong, and expected vs actual difference.	Bug Report / Issue Tracker
Step 7	Re-Test After Fix	After bug fixes, re-run failed test cases to confirm they now pass (Regression Testing).	Same test cases, updated build

7.5 Test Execution Summary

Total Test Cases	Tests Passed	Tests Failed	Pass Rate
15	15	0	100%

All 15 test cases passed successfully. The Online Grocery Shopping system performs as expected across all tested modules including User Registration, Login, Product Search, Add to Cart, Checkout, Admin Management, and Password Recovery.

8

FUTURE SCOPE & CONCLUSION

8.1 Future Enhancements

These enhancements focus on adding value and improving user experience within the existing single-store e-commerce framework:

- **Subscription Services:** Allow customers to set up recurring orders for frequently purchased items.
- **Recipe Integration:** Browse recipes and automatically add required ingredients directly to the cart.
- **Dietary Preferences & Filters:** User profile settings to specify dietary restrictions and filter products accordingly.
- **Personalised Recommendations:** Utilise purchase history to suggest relevant products, improving cross-selling.

8.2 Future Scope

These points define the long-term vision, focusing on scaling the application's reach and operational capacity:

- **Multiple Store Locations:** Expand to manage inventory, pricing, and fulfilment for more than one physical store.
- **Advanced Payment Gateways:** Integrate credit/debit cards, digital wallets, and net banking beyond Cash on Delivery.
- **Enhanced Logistics Module:** Dedicated delivery management with real-time tracking and optimised route planning.
- **Mobile Application:** Native iOS/Android apps for optimal on-the-go user experience.

8.3 Conclusion

- **Time & Energy Saving:** Customers avoid physical travel, crowds, and long checkout queues.
- **24/7 Availability:** Online stores operate round the clock, giving customers freedom to shop at any time.
- **Variety:** Access to a wide selection of products from multiple categories in one place.
- **Price Comparison:** Easy comparison of prices across products with just a few clicks.
- **Customer Satisfaction:** Online shopping is increasingly reliable; customers can share feedback and reviews.
